

Abstract

Television System

The invention relates to a television system incorporating a display screen (2), broadcast data receiver (3), remote control device (6) and the generation of an EPG on screen which provides information relating to programmes and channels which can be viewed. In accordance with the invention the user can select one or a number of said channels and/or programmes from said EPG and designate a button or button configuration on the remote control (6) for each selected channel/programme or a number of selected channels/programmes. The selected channel(s)/programme(s) typically relate to pre-defined criteria, such as subject matter categories, user-favourite channels or similar. Once designated the user can then subsequently select a channel/programme for display by depression of the appropriate button or button configuration.
